1. FLOWCHARTS

For the elaboration of the process flow-charts relating to the activities described, governed by the EC Reg. 852/2004, a particular symbol was used to facilitate the visualization of the lights and processes.

The flow diagram has the function of helping to define the dangers of the process, the possible crossings between different products and possible alternative processing solutions and therefore to identify the critical control points (CCP) of the HACCP plan.

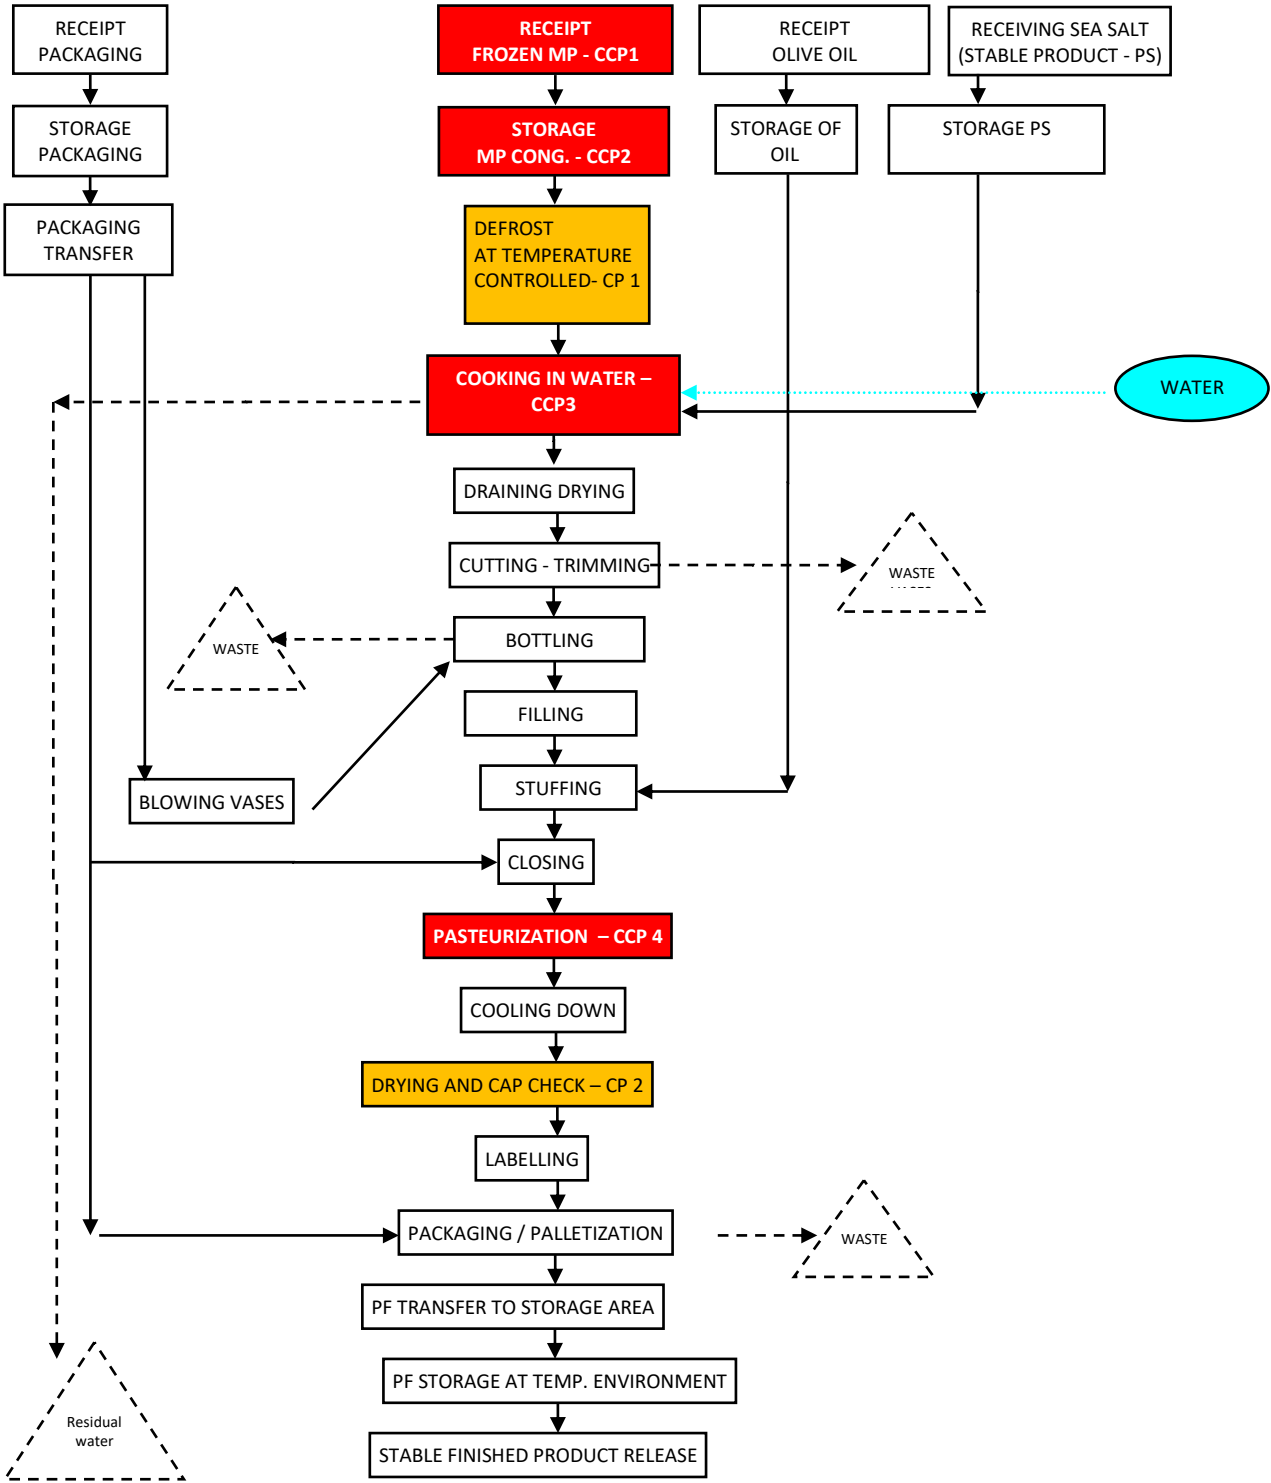

Furthermore, the same diagram can be used when training staff to understand for each phase which are the preventive activities that must be adopted.

Below is the legend of symbols and colors:

	The phase is a CP, that is, it involves an operational control
	The phase is a CCP
	The phase does not include CCP / CP and is normally managed with GMP and GHP
→	Process flow (raw materials, intermediates and packaging) If it is not continuous but interrupted by the arrow, it indicates that the flow can take two different directions (optional). If it is continuous, it indicates that the process always occurs.
- - - - ->	Waste flow (MSW: Urban Solid Waste; Waste: Category 3 Material; Residual water: processing waste destined for treatment)
- - - - ->	Water flow

2. IN-FIELD CHECK OF FLOW CHART

The HACCP team, in order to confirm the flow chart, carried out some production inspections on different days and times, found that the flow charts shown in the previous point actually reflect reality and are actually applied: therefore the flow chart has been confirmed.
